

HospiTrack Deployment Guide

✓ Pre-Deployment Checklist

All fixes have been implemented and committed:

- ✓ Map marker popups now show correct hospital names
- ✓ Location timeout increased to 30 seconds with better error handling
- ✓ All files committed to git
- ✓ Data files present (us_er.parquet)
- ✓ ML models present (triage_model.pkl, triage_encoders.pkl)
- ✓ Dockerfile.prod configured
- ✓ render.yaml blueprint ready

🚀 Deploy to Render (Recommended)

Step 1: Push to GitHub

```
cd /home/ubuntu/hospitracker
git push origin main
```

Note: If you get a permission error, you may need to:

1. Set up GitHub authentication (personal access token or SSH key)
2. Or manually push from your local machine

Step 2: Create Render Account

1. Go to <https://render.com> (<https://render.com>)
2. Sign up with your GitHub account
3. Authorize Render to access your repositories

Step 3: Deploy from Blueprint

Option A: One-Click Deploy (Easiest)

1. Click this button in your GitHub repository:

[

Option B: Manual Deploy

1. Log in to [Render Dashboard](https://dashboard.render.com) (<https://dashboard.render.com>)

2. Click **“New +”** → **“Blueprint”**
3. Connect your GitHub repository: `JZembower/Hospitracker`
4. Render will automatically detect `render.yaml`
5. Review the configuration:
 - **Service Name:** hospitracker
 - **Region:** Oregon (or choose closest to your users)
 - **Plan:** Starter (free) or Standard (\$7/month)
6. Click **“Apply”** to start deployment

Step 4: Wait for Build

- First build takes 5-10 minutes
- Render will:
 - Clone your repository
 - Build Docker image from `Dockerfile.prod`
 - Start the application
 - Run health checks

Step 5: Access Your Application

Once deployed, Render provides a public URL:

`https://hospitracker-XXXX.onrender.com`

Test the following pages:

- **Landing Page:** `/static/index.html`
- **Find Care:** `/static/home.html`
- **Explore:** `/static/explore.html`
- **Demo:** `/static/demo.html`
- **API Docs:** `/docs`

Step 6: Verify Fixes

1. **Test Map Marker Popup:**
 - Go to Explore page
 - Click on any map marker
 - Verify popup shows actual hospital name (not “Unknown Hospital”)
2. **Test Location Button:**
 - Go to Find Care page
 - Click “Use My Current Location”
 - Verify improved error message if location fails
 - Or verify coordinates populate if location succeeds

Custom Domain (Optional)

To use a custom domain like `hospitracker.com` :

1. Go to Render Dashboard → Your Service → **Settings**
2. Scroll to **Custom Domain**
3. Click **“Add Custom Domain”**
4. Enter your domain name

5. Add DNS records provided by Render to your domain registrar:

```
CNAME www hospitracker-XXXX.onrender.com
```

Monitor Your Deployment

View Logs

```
# In Render Dashboard  
Services → hospitracker → Logs
```

Health Check

```
curl https://hospitracker-XXXX.onrender.com/healthz
```

Expected response:

```
{"status": "ready"}
```

Check API

```
curl https://hospitracker-XXXX.onrender.com/api/search \  
-X POST \  
-H "Content-Type: application/json" \  
-d '{  
  "complaint": "heart_attack",  
  "priority": "time",  
  "location": "San Francisco, CA",  
  "radius_km": 25  
}'
```

Auto-Deploy Updates

Render is configured for auto-deploy on `main` branch:

1. Make changes locally
2. Commit and push to GitHub:

```
bash  
git add .  
git commit -m "Your update message"  
git push origin main
```

3. Render automatically rebuilds and deploys

Pricing

Starter Plan (Free):

- Good for development and testing
- Sleeps after 15 minutes of inactivity
- 750 hours/month free

Standard Plan (\$7/month):

- Always on
- No sleep
- Better for production use

Troubleshooting

Build Fails

Check build logs in Render dashboard for errors. Common issues:

- Missing dependencies in `requirements_fastapi.txt`
- Docker build errors
- Data files not found

Application Crashes

Check runtime logs:

```
# In Render Dashboard
Services → hospitracker → Logs → Filter: "ERROR"
```

Health Check Fails

Verify the `/healthz` endpoint is responding:

```
curl https://hospitracker-XXXX.onrender.com/healthz
```

Environment Variables

Current configuration in `render.yaml` :

Variable	Value	Description
PORT	8000	Server port
PYTHONUNBUFFERED	1	Python logging
HOSPITRACK_DATA_PATH	/app/data	Data directory
GEOCODING_CACHE_SIZE	1000	Geocoding cache size
ML_DEMO_ENABLED	true	Enable ML demo
LOG_LEVEL	INFO	Logging level

To modify:

1. Render Dashboard → Your Service → **Environment**
2. Add/edit variables
3. Click **“Save Changes”** (triggers redeploy)

Success!

Your HospiTrack application is now:

-  Deployed to Render
-  Publicly accessible
-  Auto-deploying on updates
-  Map markers show correct hospital names
-  Location timeout properly handled
