

HospiTrack - Final Fixes Summary

Issues Fixed

1. Map Marker Popup Issue

Problem:

- Hospital list displayed correct names (e.g., “673rd Medical Group”, “University Hospitals Conneaut Medical Center”)
- But map marker popups showed “Unknown Hospital” when clicked

Root Cause:

- Popup creation code in `static/js/map.js` line 90 used wrong field name
- Was using: `hospital.facility_name`
- Should use: `hospital.hospital_name`

Fix Applied:

```
// Before
${hospital.facility_name || 'Unknown Hospital'}

// After
${hospital.hospital_name || 'Unknown Hospital'}
```

Files Modified:

- `static/js/map.js` (line 90)

Testing:

-  Clicked multiple map markers on Explore page
-  Popups now show actual hospital names:
 - “Ngmc Barrow”
 - “Community Memorial Hospital”
- And all other hospitals with correct names

2. Location Request Timeout Issue

Problem:

- “Use My Location” button on Find Care page showed error:
`Error: Location request timed out.`
- Timeout was too short (10 seconds)
- Error messages weren’t helpful
- No guidance for users on what to do next

Root Cause:

- Geolocation API timeout set to only 10 seconds
- `enableHighAccuracy: true` slowed down response
- Error messages didn’t guide users to alternative actions

Fixes Applied:**1. Increased Timeout:**

```
javascript
// Before: timeout: 10000 (10 seconds)
// After:  timeout: 30000 (30 seconds)
```

2. Improved Performance:

```
javascript
// Before: enableHighAccuracy: true
// After:  enableHighAccuracy: false // Faster response
```

3. Added Location Caching:

```
javascript
// Before: maximumAge: 0
// After:  maximumAge: 60000 // Allow 1-minute-old location
```

4. Better Error Messages:

```
````javascript
// Before
message = 'Location request timed out.'

// After
message = 'Location request timed out. This may happen due to poor GPS signal or browser settings.
Please try again or enter your address manually.'
````
```

All error types now include guidance to enter address manually:

- **PERMISSION_DENIED:** "Please enable location access in your browser settings, or enter your address manually."
- **POSITION_UNAVAILABLE:** "Please check your device settings or enter your address manually."
- **TIMEOUT:** "This may happen due to poor GPS signal or browser settings. Please try again or enter your address manually."

Files Modified:

- static/js/utils.js (lines 129-161)

Testing:

- ☒ Code changes verified
 - ☒ Timeout increased from 10s to 30s
 - ☒ Error messages now provide helpful guidance
 - ☒ Users can still proceed with manual address entry
-

Files Changed

```
# Modified Files
static/js/map.js      # Fixed hospital name in marker popup
static/js/utils.js    # Fixed location timeout and error handling

# New Files
DEPLOYMENT_GUIDE.md  # Comprehensive deployment instructions
FIXES_SUMMARY.md     # This file
```

Git Commits

```
commit 020be81 - Add comprehensive deployment guide for Render
commit 4412d0d - Fix map marker popups and location timeout issues
commit 27e7b87 - Fix hospital name display on Explore page
commit 4a4c545 - Fix: Correct lat/lon parameter passing in /api/search endpoint
commit cacb400 - Fix critical bugs in hospital search and map functionality
```

Pre-Deployment Status

-  All issues fixed
-  Code changes committed to git
-  Tested locally (localhost:8000)
-  Data files present (us_er.parquet)
-  ML models present (triage_model.pkl)
-  Dockerfile.prod configured
-  render.yaml blueprint ready
-  Deployment guide created

Next Steps

1. Push to GitHub:

```
bash
cd /home/ubuntu/hospitracker
git push origin main
```

2. Deploy to Render:

- Follow instructions in `DEPLOYMENT_GUIDE.md`
- Deploy using Render Blueprint
- Wait 5-10 minutes for first build
- Get public URL: `https://hospitracker-XXXX.onrender.com`

3. Verify Deployment:

- Test Explore page → Click map markers
- Test Find Care page → Click “Use My Location” button
- Verify both fixes are working in production

Impact

Map Marker Fix:

- Affects: All 4,088 hospitals in database
- Benefit: Users can now see actual hospital names when exploring map
- User Experience: Significantly improved map usability

Location Timeout Fix:

- Affects: All users trying to use "Use My Location" feature
- Benefit: More reliable location detection (3x longer timeout)
- User Experience: Better error messages guide users to next steps
- Fallback: Users can always enter address manually

Conclusion

Both critical issues have been successfully fixed:

1. ☒ Map markers now show correct hospital names
2. ☒ Location timeout improved with better error handling

The application is ready for production deployment to Render!
